7th November, 1979.

New Patent Application
Variable Density Cigarette

I enclose a copy of the specification filed with this application.

The invention, which you will recall was mentioned informally at the last Patents Meeting, relates to smoking articles in which the packing density of the filler rod varies along the rod but is constant in any cross-section of the rod.

The official filing receipt and a further copy of the specification are being sent to Dr. Morini.

This case is now referenced RD 212.
